You can view featured content either by category or by a specific Autodesk feature. For additional information on the Autodesk Showcase Gallery, visit The Autodesk Community Portal was first introduced in December 2009 to replace the original Autodesk Community Network (ACN) Portal. The ACN Portal provided user community members with features such as personalized dashboard navigation, forums, files, and messaging. The ACN Portal allowed users to register their email addresses and create a user profile. With the introduction of the Autodesk Community Portal, we asked users to use email addresses that had been created with the original ACN Portal. For those who had not yet created a user profile, the Autodesk Community Portal provides a link to create a profile. As a result, the number of Autodesk users on the Autodesk Community Portal has grown substantially since the original ACN Portal was retired. In the coming weeks, we plan to deliver a series of updates to the Autodesk Community Portal to further improve functionality, add features, and make it more accessible. The first update is scheduled to be released on June 15. Both the original ACN Portal and the Autodesk Community Portal are managed by a single team of staff, located at Autodesk's California headquarters in San Rafael, California. These websites are maintained as part of Autodesk's customer services and support program. Autodesk's Proposal Applications

Compositing AutoCAD's compositing features are based on the Autodesk Maya compositing tool. Manipulations The editing tools in AutoCAD can be classified into two major groups: Direct manipulation. The editing process includes an explicit or implicit time-based decision process, and there is a change in the target state or state change. Model-based manipulation. The editing process includes an implicit or explicit object-based decision process, and there is no change in the target state. This distinction between the decision process and the target state, gives rise to the distinction between two kinds of tool: Direct tools: they have a direct impact on the drawing, the state of the object, or the state of the system. Model-based tools: they have an indirect impact on the drawing, the state of the object, or the state of the system. Direct tools include the pencil, brush, type tool, and their complementary tools, like the eraser or the ruler, etc. The methods used in direct tools allow one to modify the object in a manner that is completely independent from its current state. By contrast, model-based tools do not allow modifications to an object that directly change the system. The following manipulations can be performed on 2D and 3D objects: Selection and modification of a single point. Selection and modification of a line segment (a closed line). Selection and modification of an edge loop (a closed curve). Selection and modification of a rectangular closed surface. Creation and destruction of closed surfaces. Selection and modification of an open surface. Selection and modification of an open surface with a specific shape or area. Selection and modification of a polygonal surface (a closed surface consisting of a series of edges). Transparency For editing drawings containing transparent elements, there are two types of tools: Direct tools. Those tools work directly on the drawing. They have direct impact on the drawing, the state of the object, or the state of the system. Model-based tools. Those tools work indirectly on the drawing. They have no direct impact on the drawing, the state of the object, or the state of the system. Direct tools include: Selection and modification of a point or a line segment. I just got back from a trip to see relatives and didn't get a chance to look at them, but they were not what they used to be when I was a kid. The DURING the depression era, my grandparent's house was robbed and they got much of the stuff, but it was not that much in terms of the total cost of the robbery. What they had left was what was not taken, including the TV set. They would rather have got the money back and then gotten new stuff. My mom tells me that there was a great bargain on some new stuff at Sears - because that's where they were at that time, and that's where my family spent a lot of our money. I read somewhere that in the 50's and 60's, the price of steel was around \$5.50 or \$6.00 a ton. When the price doubled in 1973, the prices of so many other things doubled and doubled and doubled. If you think about it, steel is a primary building material. So, the economy can affect the price of steel by an order of magnitude. But a person has to go and buy a new house to get a price bump of \$100,000 or \$300,000. I have to assume, from what I was told, that the '65 was a really lousy year for steel prices. Would the \$100k for a new house have been in the normal range back then, or was it considerably more expensive?
